

# Predicting Global Crop Yields

From Water Resource Availability and Socioeconomic Factors Across Countries

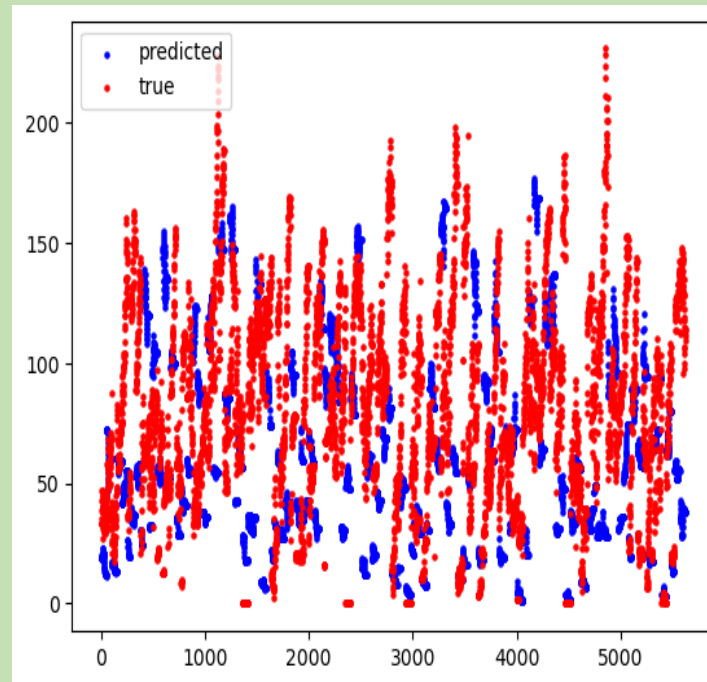

We combined datasets from [Aquastat data](#) and <https://ourworldindata.org/crop-yields> to implement 3 Regression Models:

Regression Decision Tree

MSE: 664

Linear Regression Model

MSE: 2361

Regression Neural Network

MSE: 95.3

The “total renewable water resources” and “GDP per capita” were most significant factors in predicting total crop yield.
